

# LHC: future measurements and reach

Paolo Giacomelli (INFN Bologna)  
Facing the Scalar Sector, Solvay Workshop  
Friday, May 31st, 2013

# Outline

- Where we stand today
- LHC and HL-LHC luminosity projections
- Physics priorities
- CMS and ATLAS upgrade programs
- Scalar boson physics projections
- Scalar boson rare decays
- Scalar boson self-coupling
- VV scattering
- SUSY prospects
- Exotics projections

# Integrated luminosity in 2012

Integrated luminosity recorded in 2012:  $\sim 22 \text{ fb}^{-1}$

2011:  $L \sim 6 \text{ fb}^{-1}$

CMS Integrated Luminosity, pp, 2012,  $\sqrt{s} = 8 \text{ TeV}$

Data included from 2012-04-04 22:37 to 2012-12-16 20:49 UTC

Total delivered luminosity:  $\sim 30 \text{ fb}^{-1}$

Total recorded luminosity:  $\sim 27 \text{ fb}^{-1}$

Excellent LHC performance and very high data-taking efficiency of the two detectors

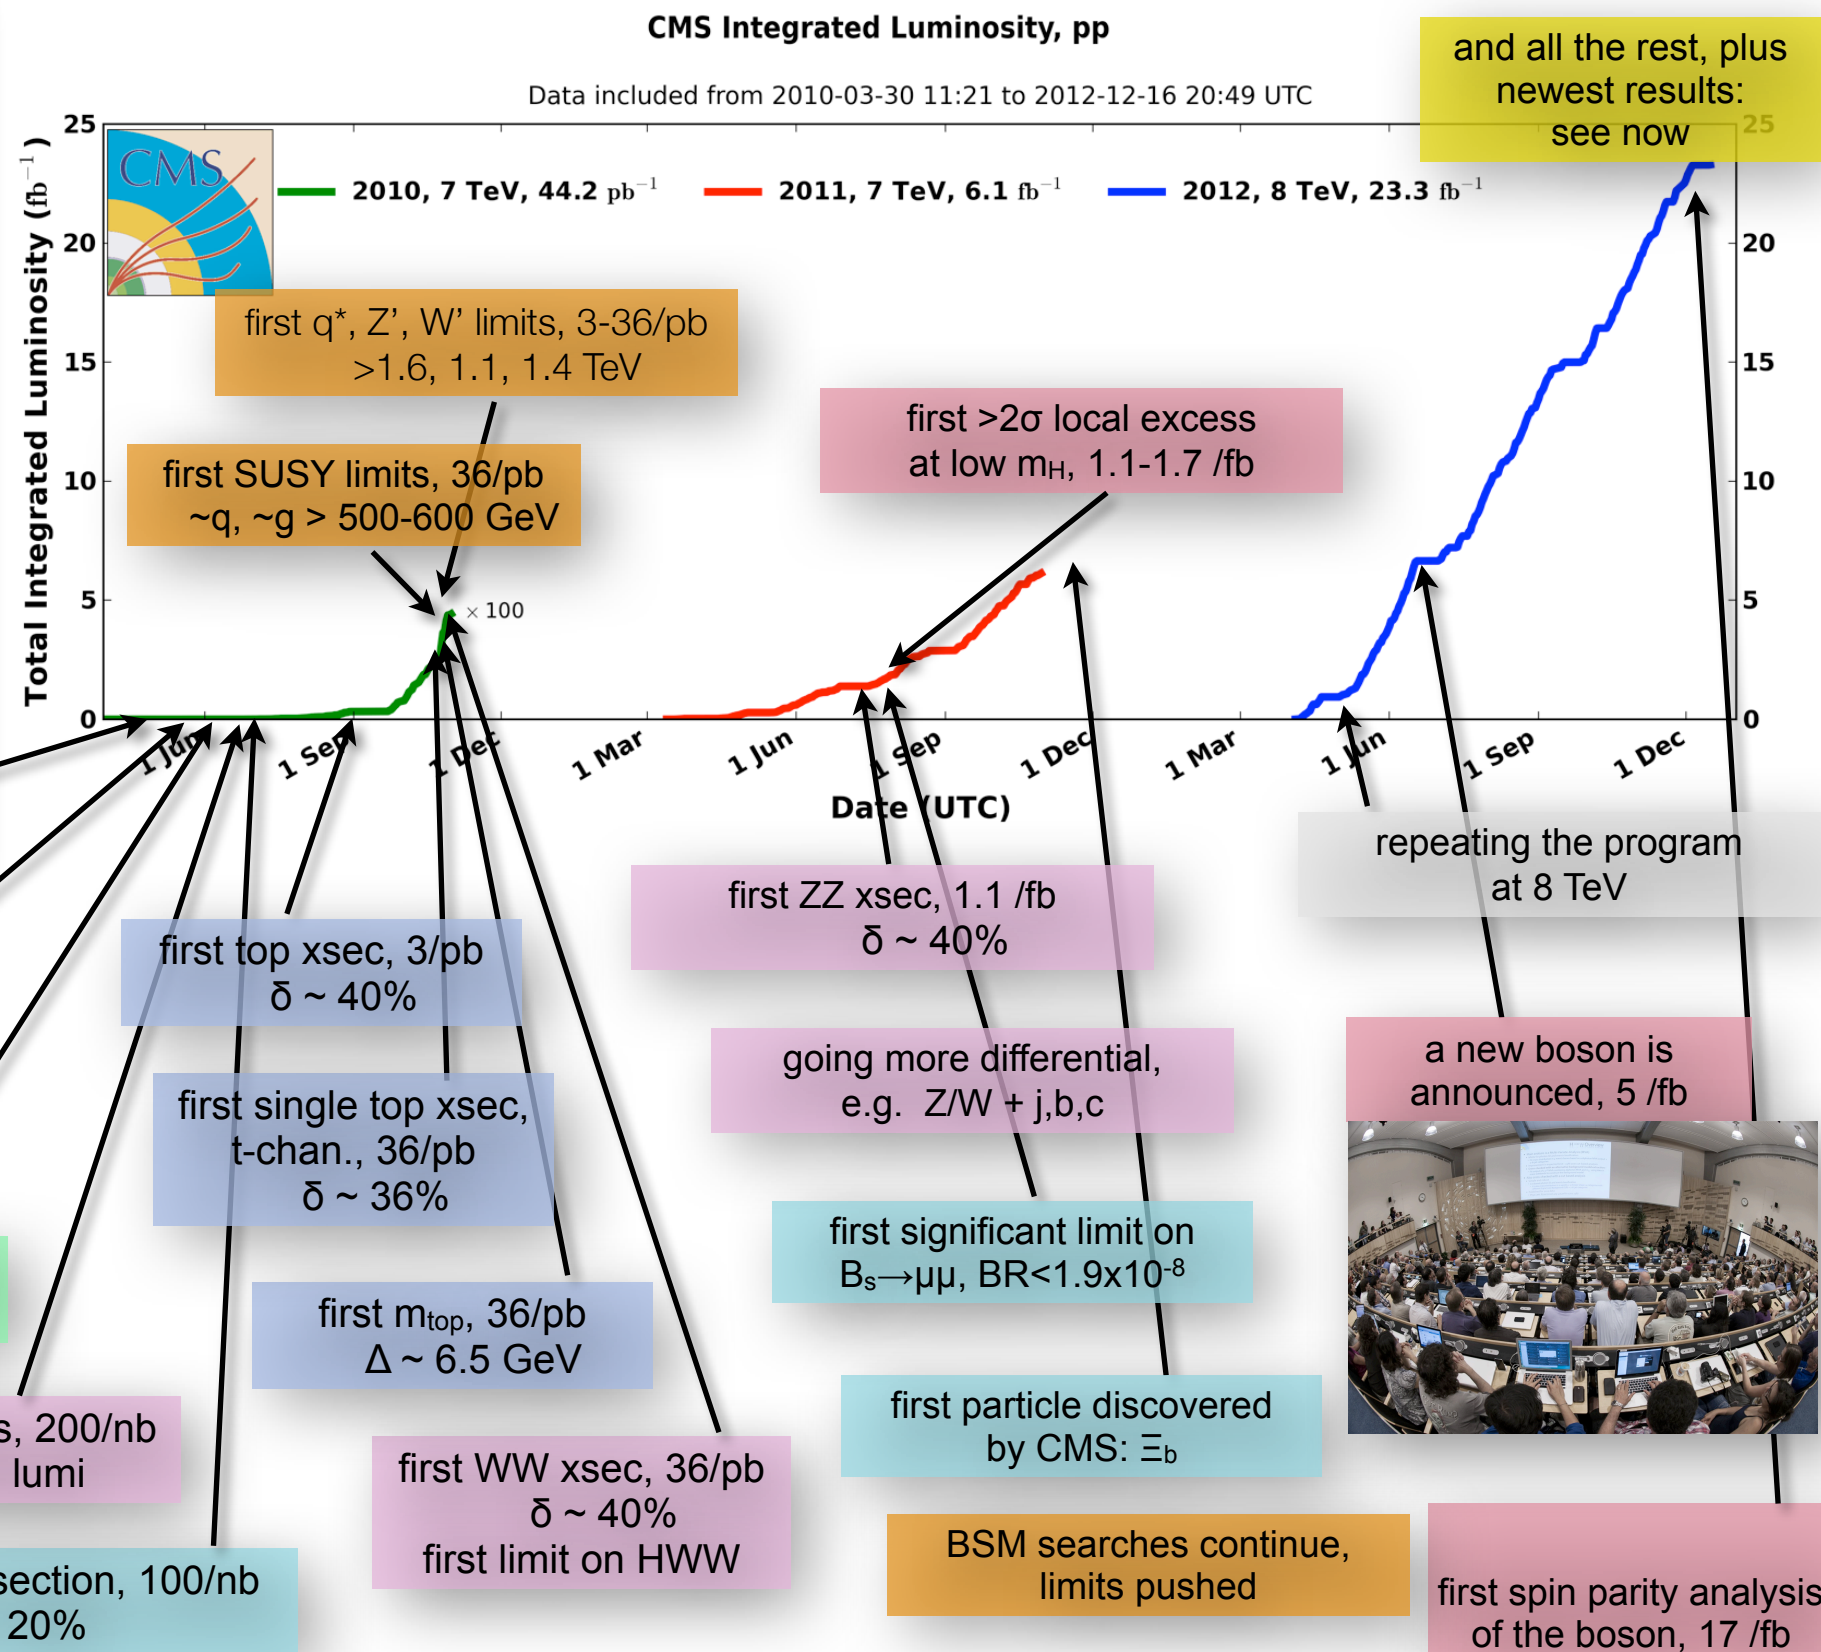

# A 3-year long sprint....

CMS as example ...

Ch. Sander

$\delta$  .. relative uncert.  
 $\Delta$  .. absolute uncert.

Facing the Scalar Sector, 31/05/2013

LHC: future measurements and reach - Paolo Giacomelli

# New boson with a mass of $\sim 125$ GeV

- We have discovered a SM-like scalar boson with a mass of  $\sim 125$  GeV.
- $J^{PC}$ , consistent with SM scalar boson, couplings will need more data.

The new boson is consistent with being the SM scalar boson

$$\sigma/\sigma_{\text{SM}} = 0.80 \pm 0.14$$

# LHC and HL-LHC

## LHC

Energy increase  
8 TeV to 13/14 TeV

Injection  
upgrade

## HL-LHC

ATLAS, CMS  
Upgrade plan

$8 \times 10^{33} \text{ Hz/cm}^2$   
 $30 \text{ fb}^{-1}$   
PU ~40

LS1

Phase 1 Upgrade

$2 \times 10^{34} \text{ Hz/cm}^2$   
 $300 \text{ fb}^{-1}$   
PU ~50

LS3

Phase 2 Upgrade

$5 \times 10^{34} \text{ Hz/cm}^2$   
 $3000 \text{ fb}^{-1}$   
PU ~140

**We are about to explore a new territory!**

# Detector and trigger challenges

- Need detectors and trigger with high performances from low to high energy scales
  - 125 GeV SM-like boson measurements
  - Multi-TeV new physics searches
- **Phase 1 Upgrade:** twice LHC design luminosity
  - Event pileup reaches ~50 collisions per beam crossing (@ 25 ns)
  - Factor 5 increase in trigger rates relative to 2012 run
- **Phase 2 Upgrade:** 5x LHC design luminosity
  - Event pileup reaches ~140 collisions per beam crossing (@ 25 ns)
  - Need solutions to cope with very high rates (10-15 x 2012), radiation and pileup

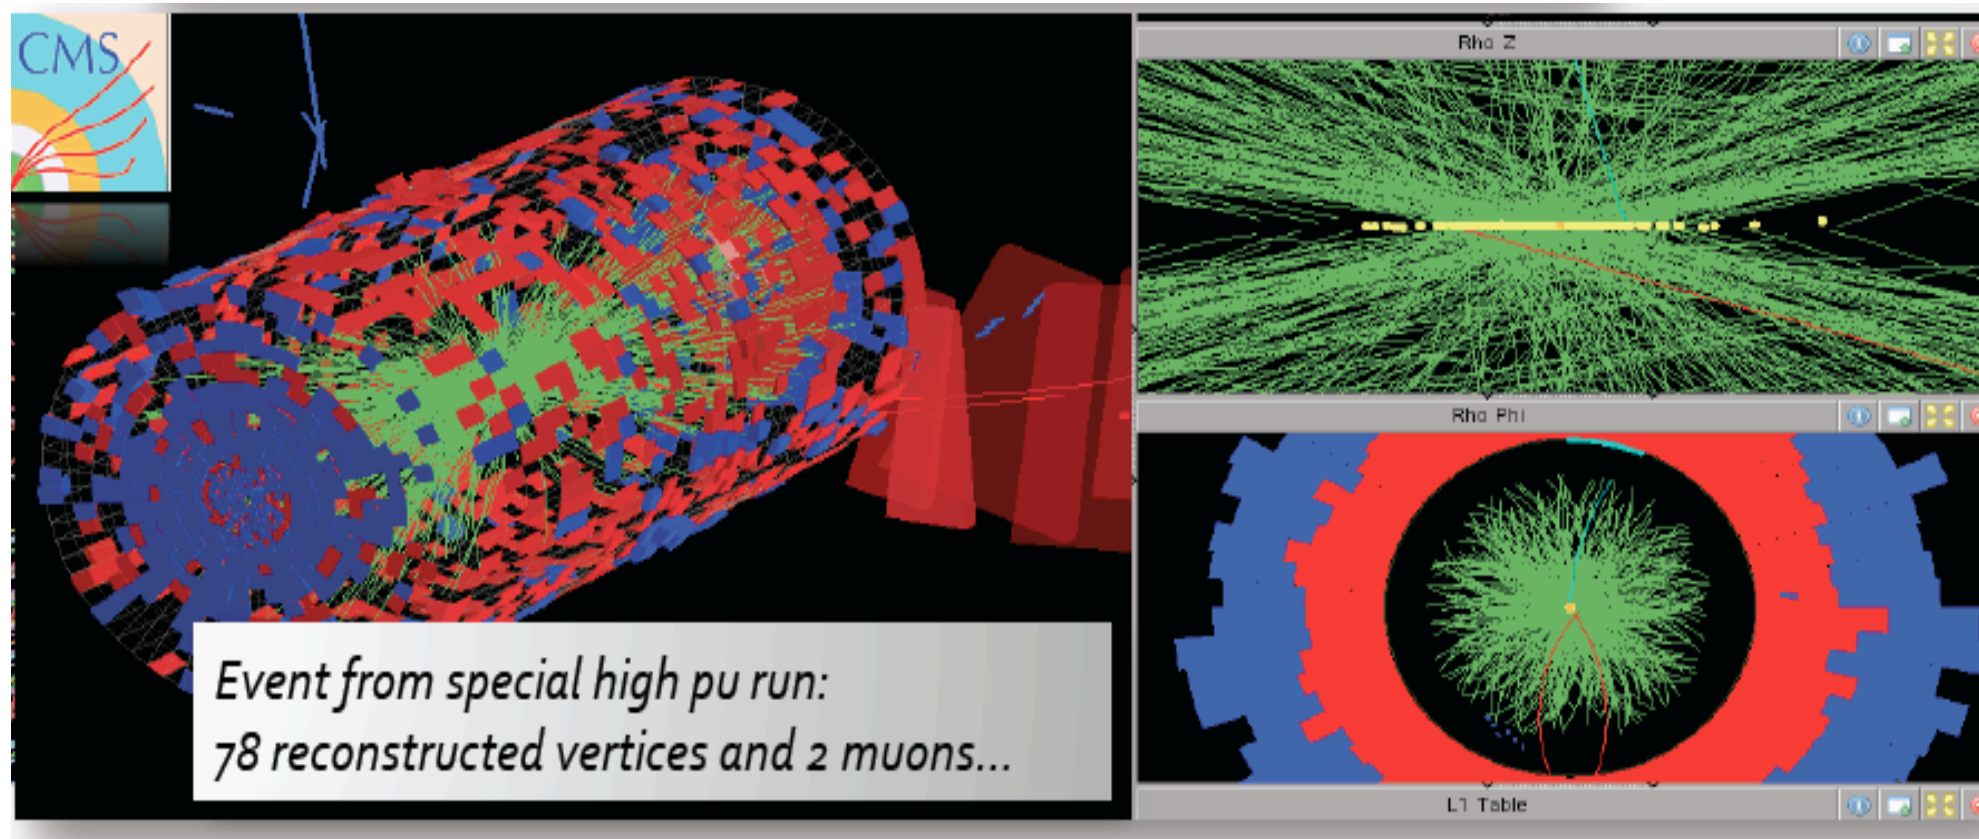

ATLAS and CMS were designed to cope with  $L = 1\text{-}2 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$

# Pileup in 2012

**Peak: 37 pileup events**

Design value  
**25 pileup events**  
( $L=10^{34}$ , BX=25 ns)

Basically, life will not be easy...

*Pileup at 25 ns and  $L = 2 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$*

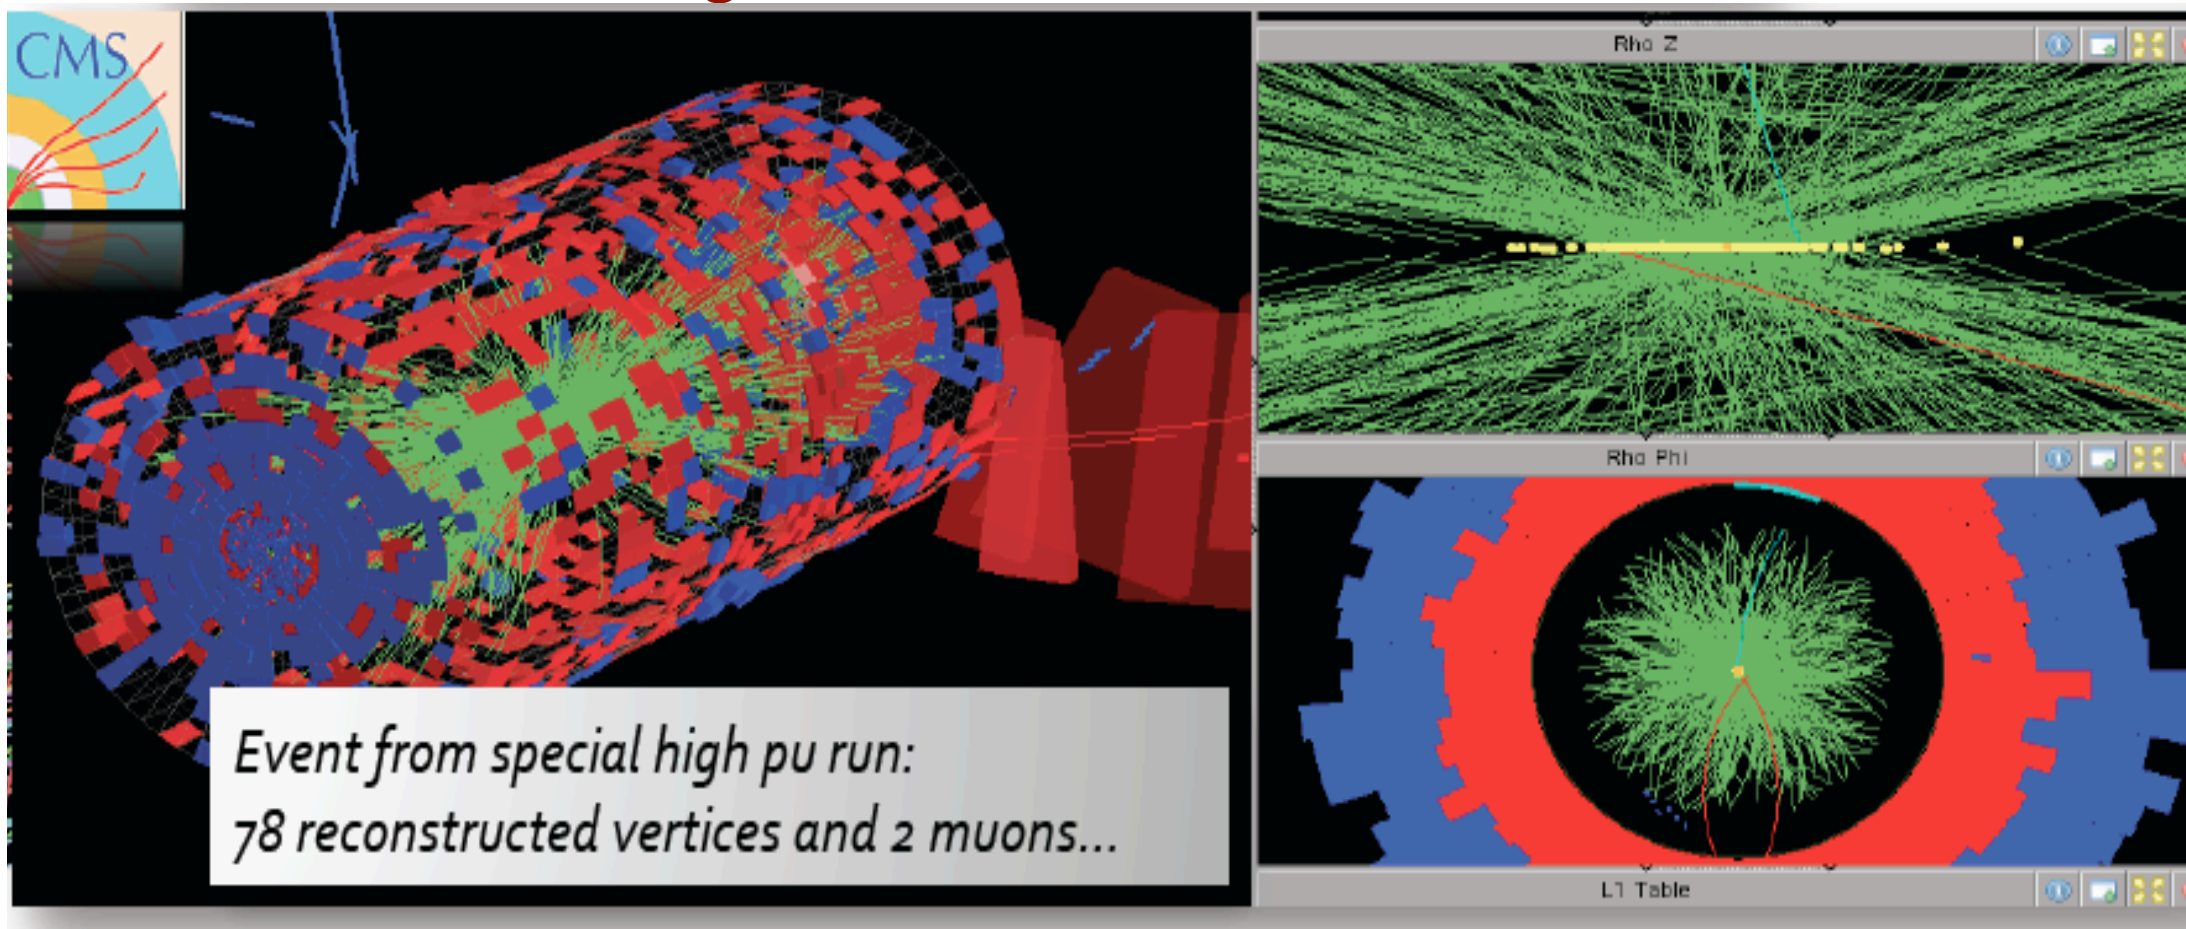

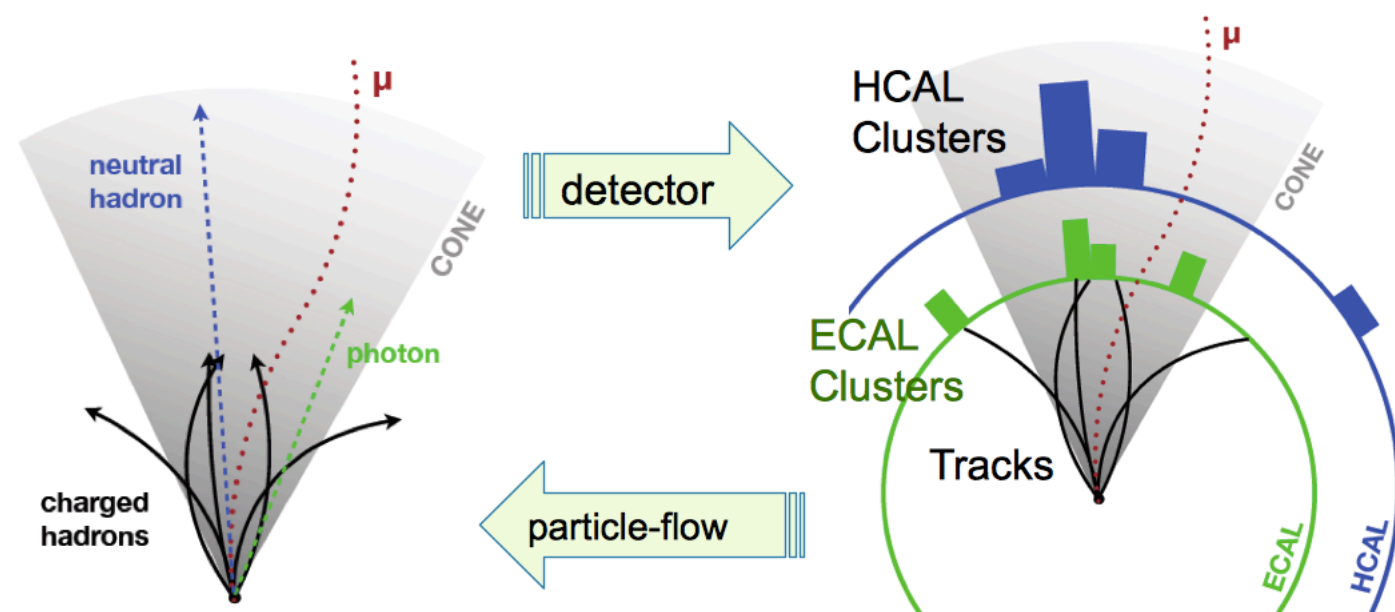

# Upgrade challenges and recipe

Maintain low trigger thresholds, efficient particle and physics object reconstruction at high rate and pile-up

Need new technology R&Ds to:

- Increase granularity
- Increase data bandwidth
- Increase processing power
- Improve radiation hardness
- Minimize material in tracking devices

# Physics program priorities

The discovery of a SM-like scalar boson at  $m_H \sim 125$  GeV defines the physics priorities

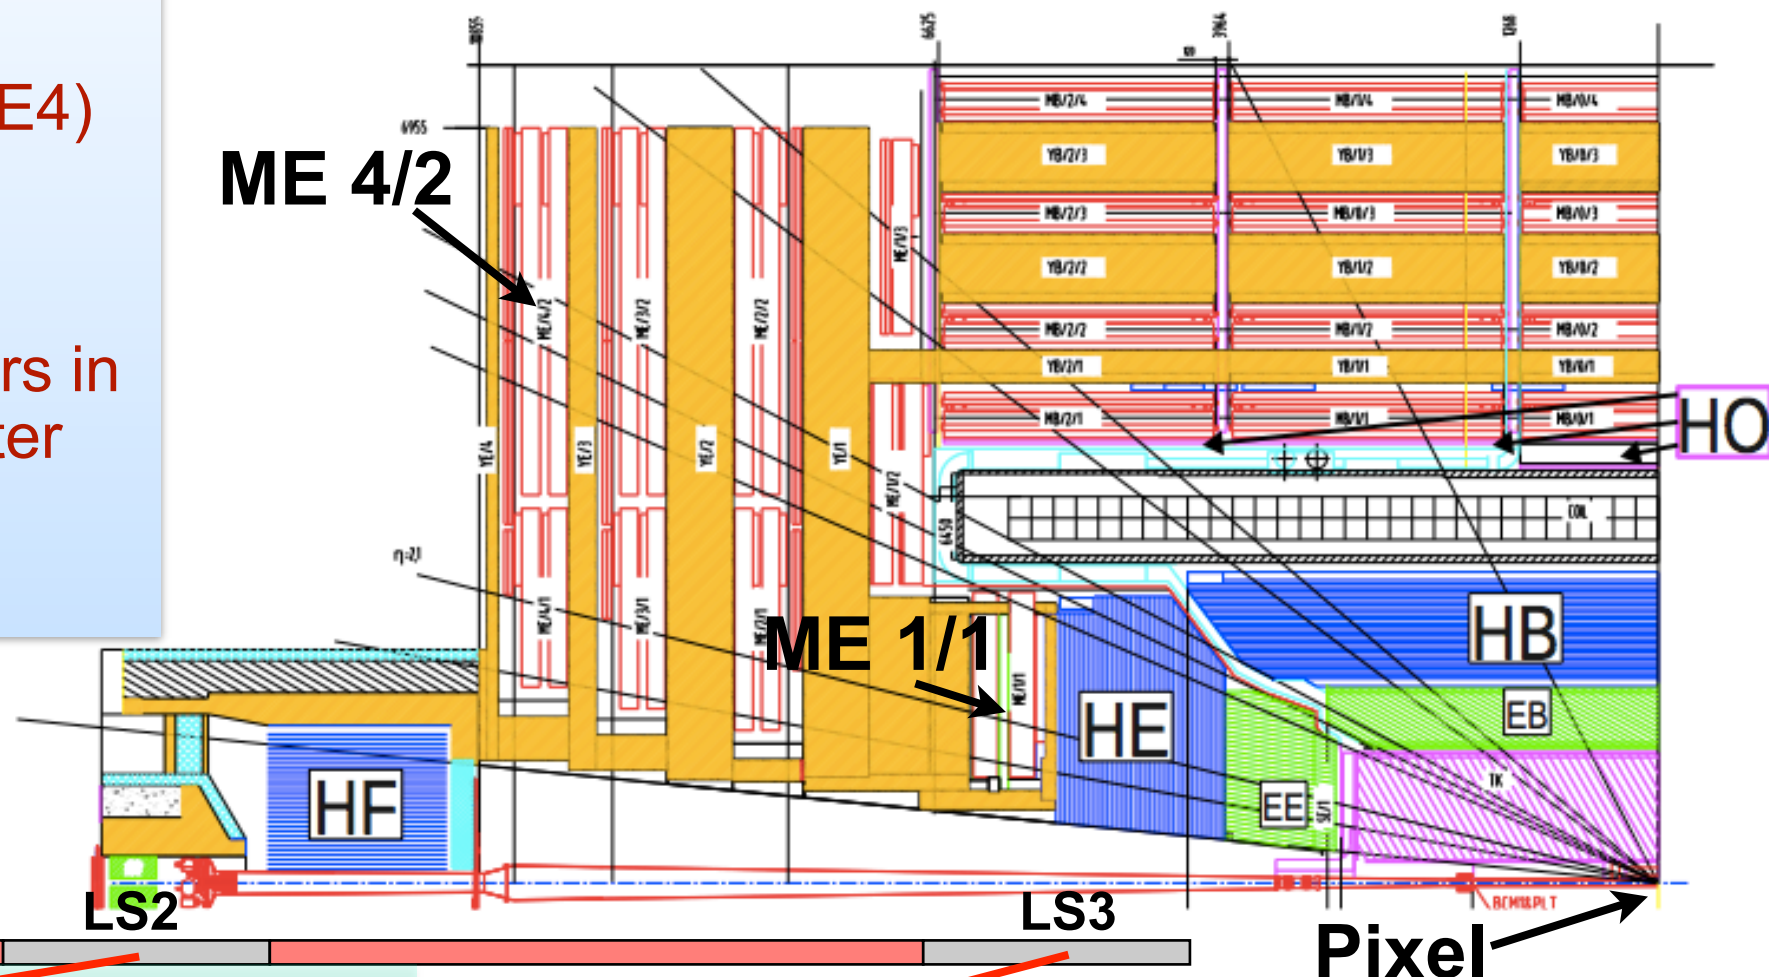

- With LHC 13/14 TeV data until  $\sim 2022$  ( $\sim 300 \text{ fb}^{-1}$ )
  - Measure SM-like scalar boson properties
    - mass,  $J^{PC}$
    - individual couplings with 5-15% precision
  - Search for new physics at a higher mass scale (new energy region)
    - SUSY
    - Exotics
- With **HL-LHC** 14 TeV data until  $\sim 2032$  ( $\sim 3000 \text{ fb}^{-1}$ )
  - High Precision SM scalar boson measurements
  - Study scalar boson rare decays and self-coupling
  - Study VV scattering
  - Characterize any New Physics discovered during Phase 1 at 14 TeV
  - Search for new physics in very rare processes

# CMS upgrade program

## LS1 Projects

- Complete Muon coverage (ME4)
- Improve muon operation, DT electronics
- Replace HCAL photo-detectors in Forward (new PMTs) and Outer (HPD→SiPMs)
- DAQ1→DAQ2

## Phase 1 Upgrades

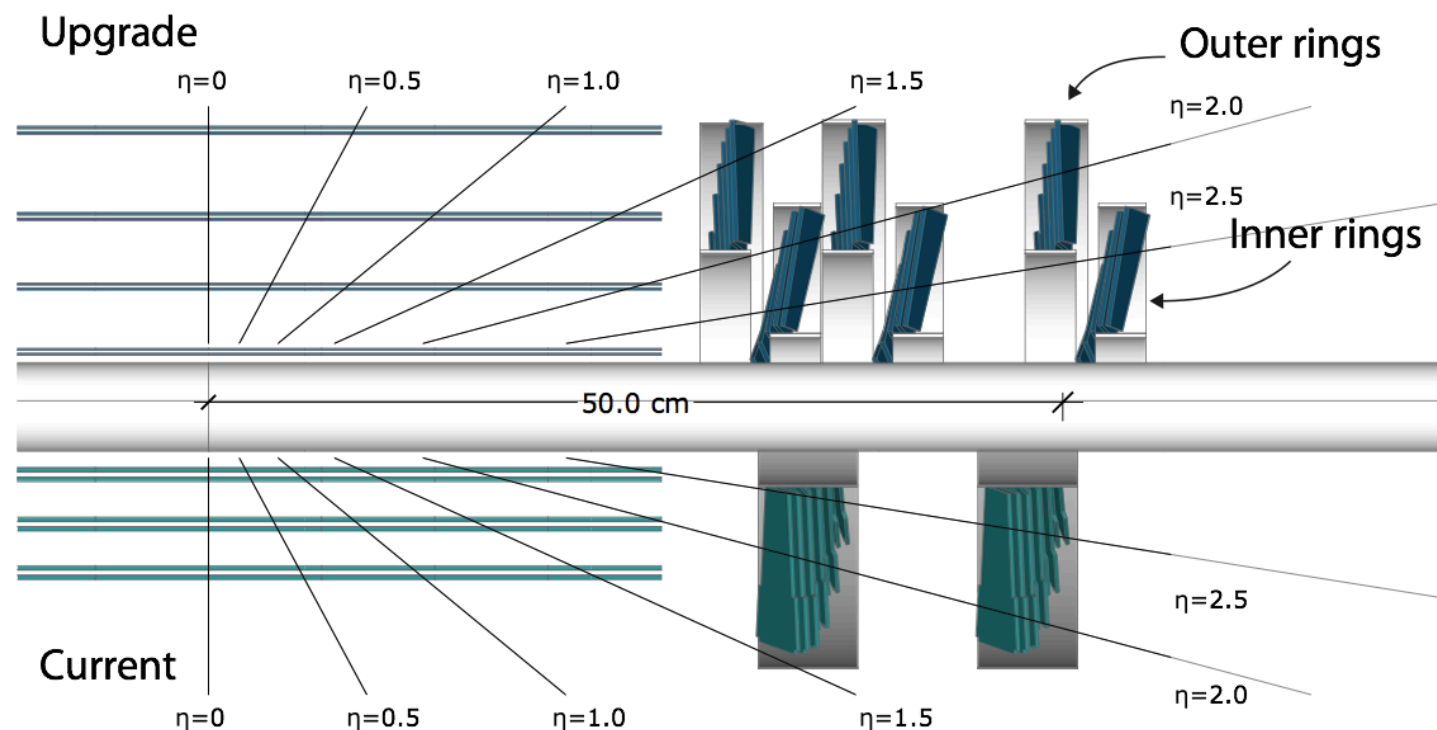

- New Pixel detector, HCAL electronics and L1-Trigger upgrade
- GEMs for forward muon det. under review
- Preparatory work during LS1
  - New beam pipe for pixel upgrade
  - Install test slices of pixel, HCAL, L1-trigger
  - Install ECAL optical splitters for L1-trigger

## Phase 2: being defined now

- Tracker replacement, L1 Track-Trigger
- Forward: calorimetry, muons and tracking
- High precision timing for PU mitigation
- Further Trigger upgrade
- Further DAQ upgrade

# Pixel and HCAL phase 1 upgrades

## New 4-layer pixel detector Pixel

## • Upgraded HCAL

- New photodetectors
- New electronics (frontend, backend)
- Improved longitudinal segmentation
- Improved background rejection, Missing  $E_T$  resolution and Particle Flow reconstruction

# Expected Phase 1 improvements

Significant gain in signal reconstruction efficiency:

$H \rightarrow 4\mu$	+41%
$H \rightarrow 2\mu 2e$	+48%
$H \rightarrow 4e$	+51%

Total efficiency improvement:  
factor of 2.5 (4.5%  $\rightarrow$  11%)

Improved jet and MET  $\rightarrow$  25% improvement in  $m_{\tau\tau}$  resolution

# ATLAS upgrade program

## ATLAS has devised a 3 stage upgrade program

- |   |   |  |
|---|---|--|
| <ul style="list-style-type: none"> <li>• New insertable pixel b-layer (IBL)</li> <li>• New Al beam pipe</li> <li>• New pixel services</li> <li>• Complete installation of EE muon chambers</li> <li>• New evaporative cooling plant</li> <li>• Consolidation of detector services</li> <li>• Specific neutron shielding</li> <li>• Upgrade magnet cryogenics</li> </ul> | <ul style="list-style-type: none"> <li>• New Small Wheel (nSW) for the forward muon Spectrometer</li> <li>• High Precision Calorimeter L1-Trigger</li> <li>• Fast TrackKing (FTK) for L2-trigger</li> <li>• Topological L1-trigger processors</li> <li>• New forward diffractive physics detectors (AFP)</li> </ul> | <ul style="list-style-type: none"> <li>• Completely new tracking detector</li> <li>• Calorimeter electronics upgrades</li> <li>• Upgrade part of the muon system</li> <li>• Possible L1-trigger track trigger</li> <li>• Possible changes to the forward calorimeters</li> </ul> |
|---|---|--|

# From 2013 to HL-LHC

- From 30 to 3000  $\text{fb}^{-1}$ : two orders of magnitude extrapolation in luminosity

To calculate physics projections at HL-LHC

**Similar trigger and reconstruction performances as in 2012**

**Need upgraded detectors to offset the much harsher LHC conditions and radiation damage**

**ATLAS and CMS have launched a comprehensive upgrade program**

# Scalar boson projections after LS1

## Approaches adopted for physics projections

- **ATLAS:** perform physics studies using fast simulation to mimic the beam effects on momentum and energy resolution, acceptance, identification and reconstruction efficiencies, fake rates, etc.
- **CMS:** assume that an upgraded detector will compensate the effects of the higher pile-up, using three different scenarios:
  - Scenario 1: all systematic uncertainties are kept unchanged with respect to those in current data analyses
  - Scenario 2: the theoretical uncertainties are scaled by a factor of  $1/2$ , while other systematical uncertainties are scaled by  $1/\sqrt{L}$
  - Scenario 3: set theoretical uncertainties to zero, leave other syst. uncertainties the same as in 2012

# Scalar boson signal with 300 fb<sup>-1</sup>

- Upgraded detector performances assumed the same as 2012 detector
- Three scenarios:
  - Scenario 1:** same systematics as in 2012
  - Scenario 2:** theory systematics scaled by a factor  $\frac{1}{2}$ , other systematics scaled by  $1/\sqrt{L}$
  - Scenario 3:** same exp. syst. as in 2012, w/o theory uncertainty

## CMS Projection

10 fb<sup>-1</sup>, 7 and 8 TeV (Scenario 1)  
 300 fb<sup>-1</sup>, 14 TeV (Scenario 1)  
 300 fb<sup>-1</sup>, 14 TeV (Scenario 3)

With 300 fb<sup>-1</sup> the precision on the signal strength is expected to be **10-15%** per channel

# Scalar boson couplings @300 fb<sup>-1</sup>

- Three scenarios:
  - **Scenario 1**: same systematics as in 2012
  - **Scenario 2**: theory systematics scaled by a factor 1/2, other systematics scaled by 1/√L
  - **Scenario 3**: same exp. syst. as in 2012, w/o theory uncertainty

CMS Projection

300 fb<sup>-1</sup> 14 TeV, Scenario 1

300 fb<sup>-1</sup> 14 TeV, Scenario 2

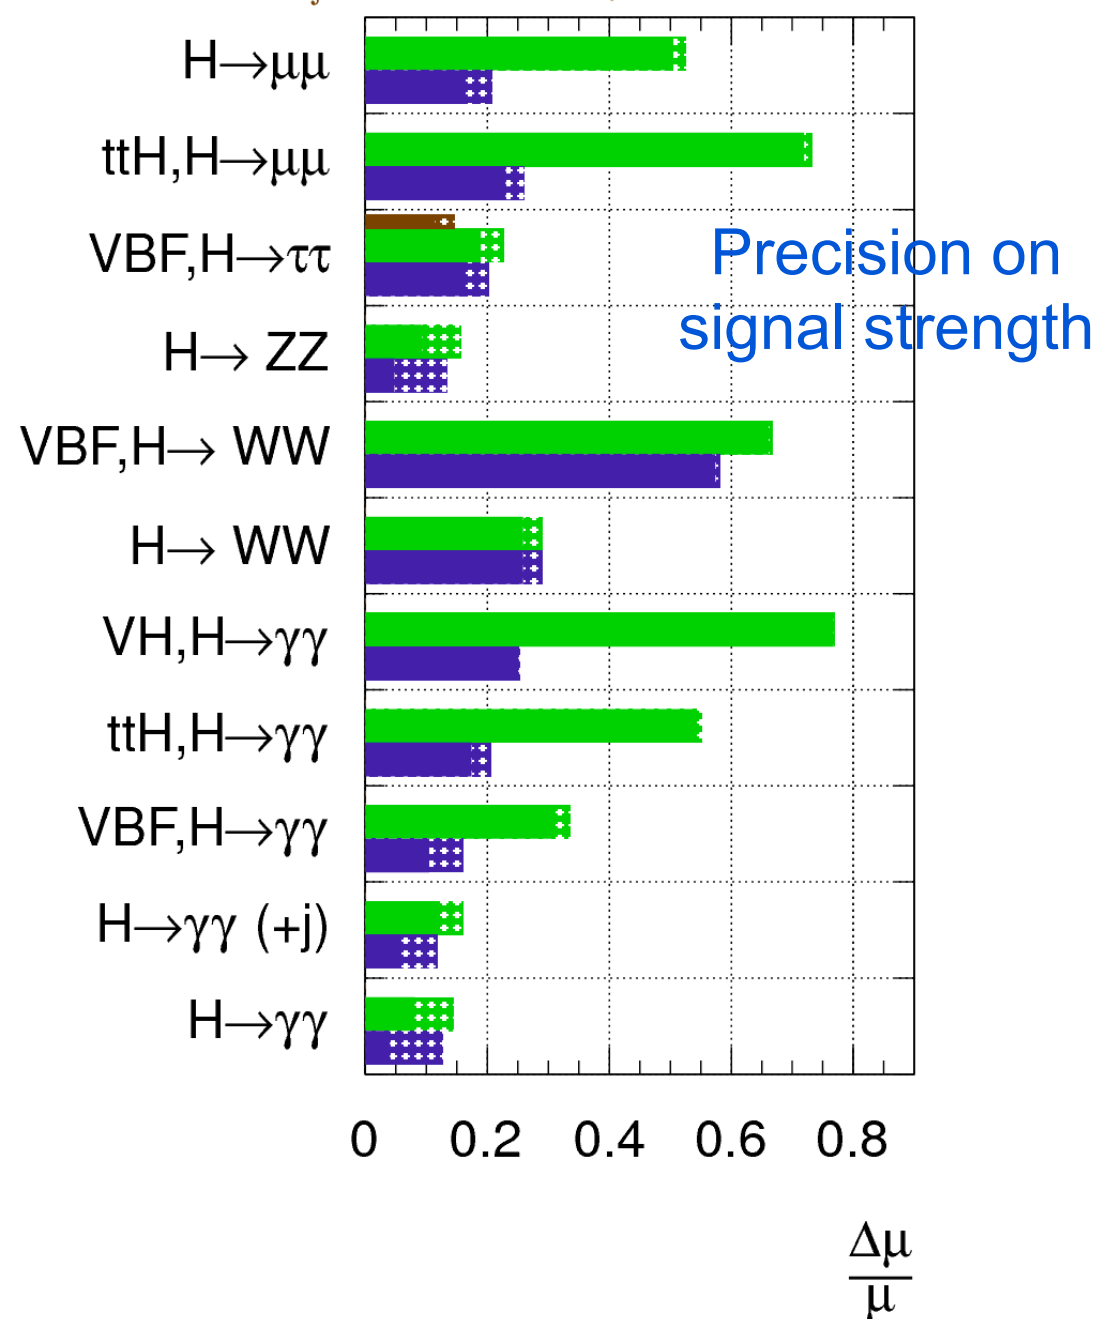

With 300 fb<sup>-1</sup> the uncertainties on the Higgs couplings are expected in the range  $\sigma(\kappa_V) \sim 3-6\%$   
 $\sigma(\kappa_f) \sim 5-15\%$

# Scalar boson couplings @3000 fb<sup>-1</sup>

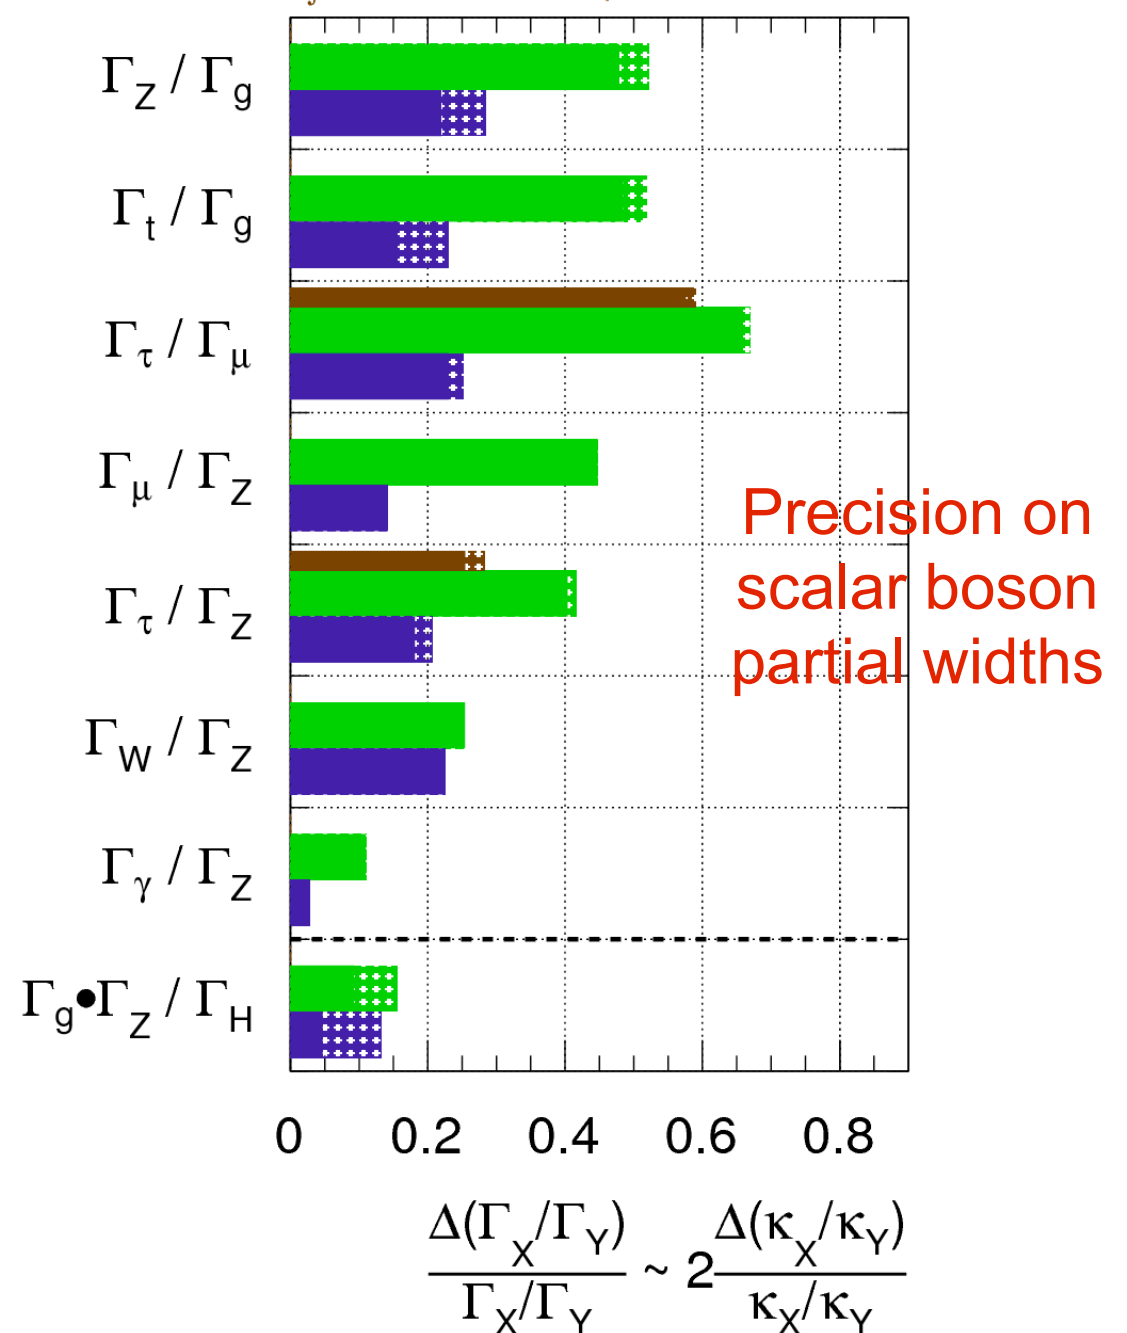

**ATLAS Preliminary (Simulation)**

$\sqrt{s} = 14$  TeV:  $\int \mathcal{L} dt = 300 \text{ fb}^{-1}$  ;  $\int \mathcal{L} dt = 3000 \text{ fb}^{-1}$   
 $\int \mathcal{L} dt = 300 \text{ fb}^{-1}$  extrapolated from 7+8 TeV

**ATLAS Preliminary (Simulation)**

$\sqrt{s} = 14$  TeV:  $\int \mathcal{L} dt = 300 \text{ fb}^{-1}$  ;  $\int \mathcal{L} dt = 3000 \text{ fb}^{-1}$   
 $\int \mathcal{L} dt = 300 \text{ fb}^{-1}$  extrapolated from 7+8 TeV

- With 3000 fb<sup>-1</sup> the couplings can be determined with high precision (a few %)

# HL-LHC boson couplings @3000 fb<sup>-1</sup>

- Extrapolation by two orders of magnitude to higher luminosity
  - is subject to large uncertainties
  - scenarios 1 and 2 provide likely upper and lower bounds
- Experience at LEP and Tevatron indicates that scaling with  $1/\sqrt{L}$  is not unrealistic

CMS Coupling	Uncertainty (%)	
	3000 fb <sup>-1</sup>	
	Scenario 1	Scenario 2
$\kappa_\gamma$	5.4	1.5
$\kappa_V$	4.5	1.0
$\kappa_g$	7.5	2.7
$\kappa_b$	11	2.7
$\kappa_t$	8.0	3.9
$\kappa_\tau$	5.4	2.0

- With 3000 fb<sup>-1</sup> the Higgs couplings can be determined with high precision (1-4%)

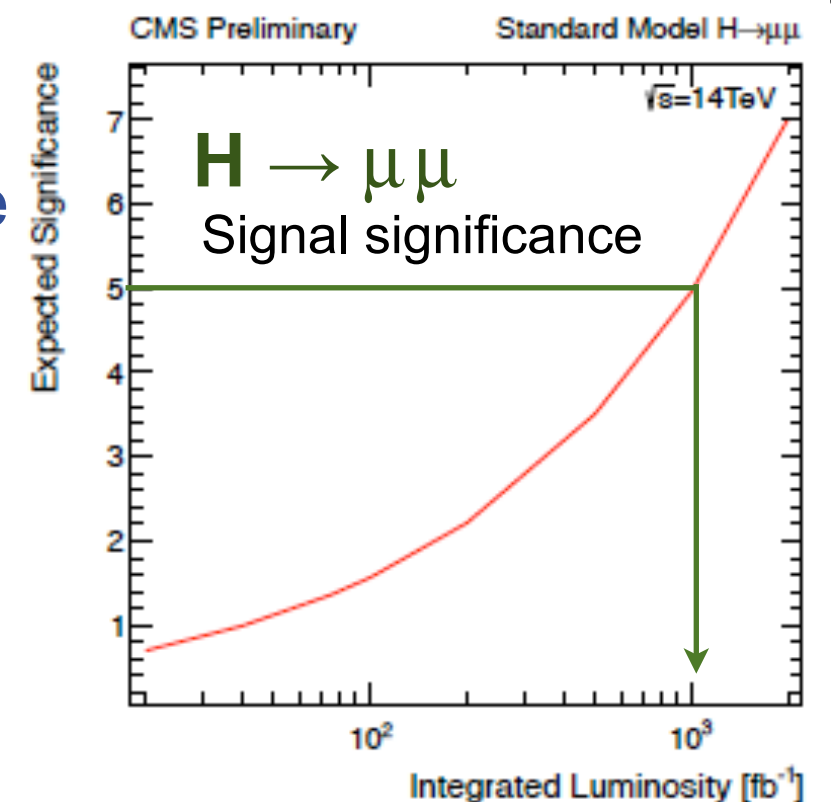

Scenario 1: systematics as in 2012

Scenario 2: theory syst. scaled by a factor 1/2, other systematics scaled by  $1/\sqrt{L}$

## $H \rightarrow Z(ee)\gamma$

- The decay  $H \rightarrow \mu\mu$  can be observed with a significance of 5 sigma
- measurement of the  $H\mu\mu$  coupling with a precision of  $\sim 10\%$

# Scalar boson self-coupling

Destructive interference between the two diagrams

Many channels to investigate.  
Most promising ones:

$b\bar{b}W^+W^-$  (large BR but large bkg.)

$b\bar{b}\gamma\gamma$  (clean but small BR)

$b\bar{b}\tau^+\tau^-$

$b\bar{b}\mu^+\mu^-$  also being considered

$b\bar{b}b\bar{b}$

Taken from “Higgs self-coupling measurements at the LHC” by M. J. Dolan, C. Englert and M. Spanowsky, JHEP 10 (2012) 112.

NLO cross-section at  $m_H=125$  GeV:

$$\sigma = 34 \text{ fb}^{+18\%}_{-15\%} \text{ (QCD scale)} \pm 7\% \text{ (PDF+}\alpha_s) \pm 10\% \text{ (EFT)}$$

$$HH \rightarrow b\bar{b}\gamma\gamma$$

A sensitivity of  $3\sigma$  per experiment is within reach with  $L=3000 \text{ fb}^{-1}$

# VV scattering: unitarity violation

**VV → VV**

**S channel**

**T channel**

**QGC**

Without the SM boson,  $W^+_L W^-_L \rightarrow W^+_L W^-_L$  violates unitarity at  $\sqrt{s} \geq 1.2$  TeV

W, Z masses ( $\rightarrow$  longitudinal degrees of freedom) arise from the BEH mechanism:

$$A(W^+_L W^-_L \rightarrow W^+_L W^-_L) \approx \frac{1}{v^2} \left( \boxed{-s - t} + \frac{s^2}{s - m_H^2} + \frac{t^2}{t - m_H^2} \right)$$

**VV scattering is the smoking gun for EWSB!**

Taken from “Prospects for VV scattering: latest news” by S. Bolognesi (JHU)  
talk at Implications of LHC results for TeV-Scale physics (March 2012)

# VV scattering as a probe for EWSB

## VV Scattering spectrum, $\sigma(VV \rightarrow VV)$ vs $M(VV)$

is the fundamental probe to test the nature of the BEH boson or to find an alternative EWSB mechanism

Search for possible resonances in VBF spectrum

Adaptation from “Boson Boson scattering analysis” by A.Ballestrero (INFN Torino)  
talk at First LHC to Terascale Workshop (Sept 2011):

# VBF experimental signature

## Longitudinal plane

## Transverse plane

- ▶ tagging jets (1): large  $p_T$ , large  $\Delta\eta$
- ▶ few jets between tagging jets
- ▶ final state  $\ell\nu\ell\nu$ :
  - ▶ leptons (2) between tagging jets
  - ▶ missing  $E_T(3)$

Six fermion  
final state

From "Study of Vector Boson Scattering including Pile-up with the ATLAS Detector"  
by P. Anger (TU Dresden), DPG Frühjahrstagung Karlsruhe 2011

# VBF final states

- According to the vector bosons' decays we have a multitude of possible final states. We can group them in:

- **Fully leptonic**

- $pp \rightarrow qq \ell\ell\ell\ell$  ( $\ell = \mu, e$ )
- $pp \rightarrow qq \ell\ell\ell\nu$
- $pp \rightarrow qq \ell\ell\nu\nu$

Clean

Can reconstruct  $m_{VV}$  (not with  $2\nu$ )

Very low yields...

- **Semi-leptonic**

- $pp \rightarrow qq \text{ jetjet } \ell\ell$
- $pp \rightarrow qq \text{ jetjet } \ell\nu$

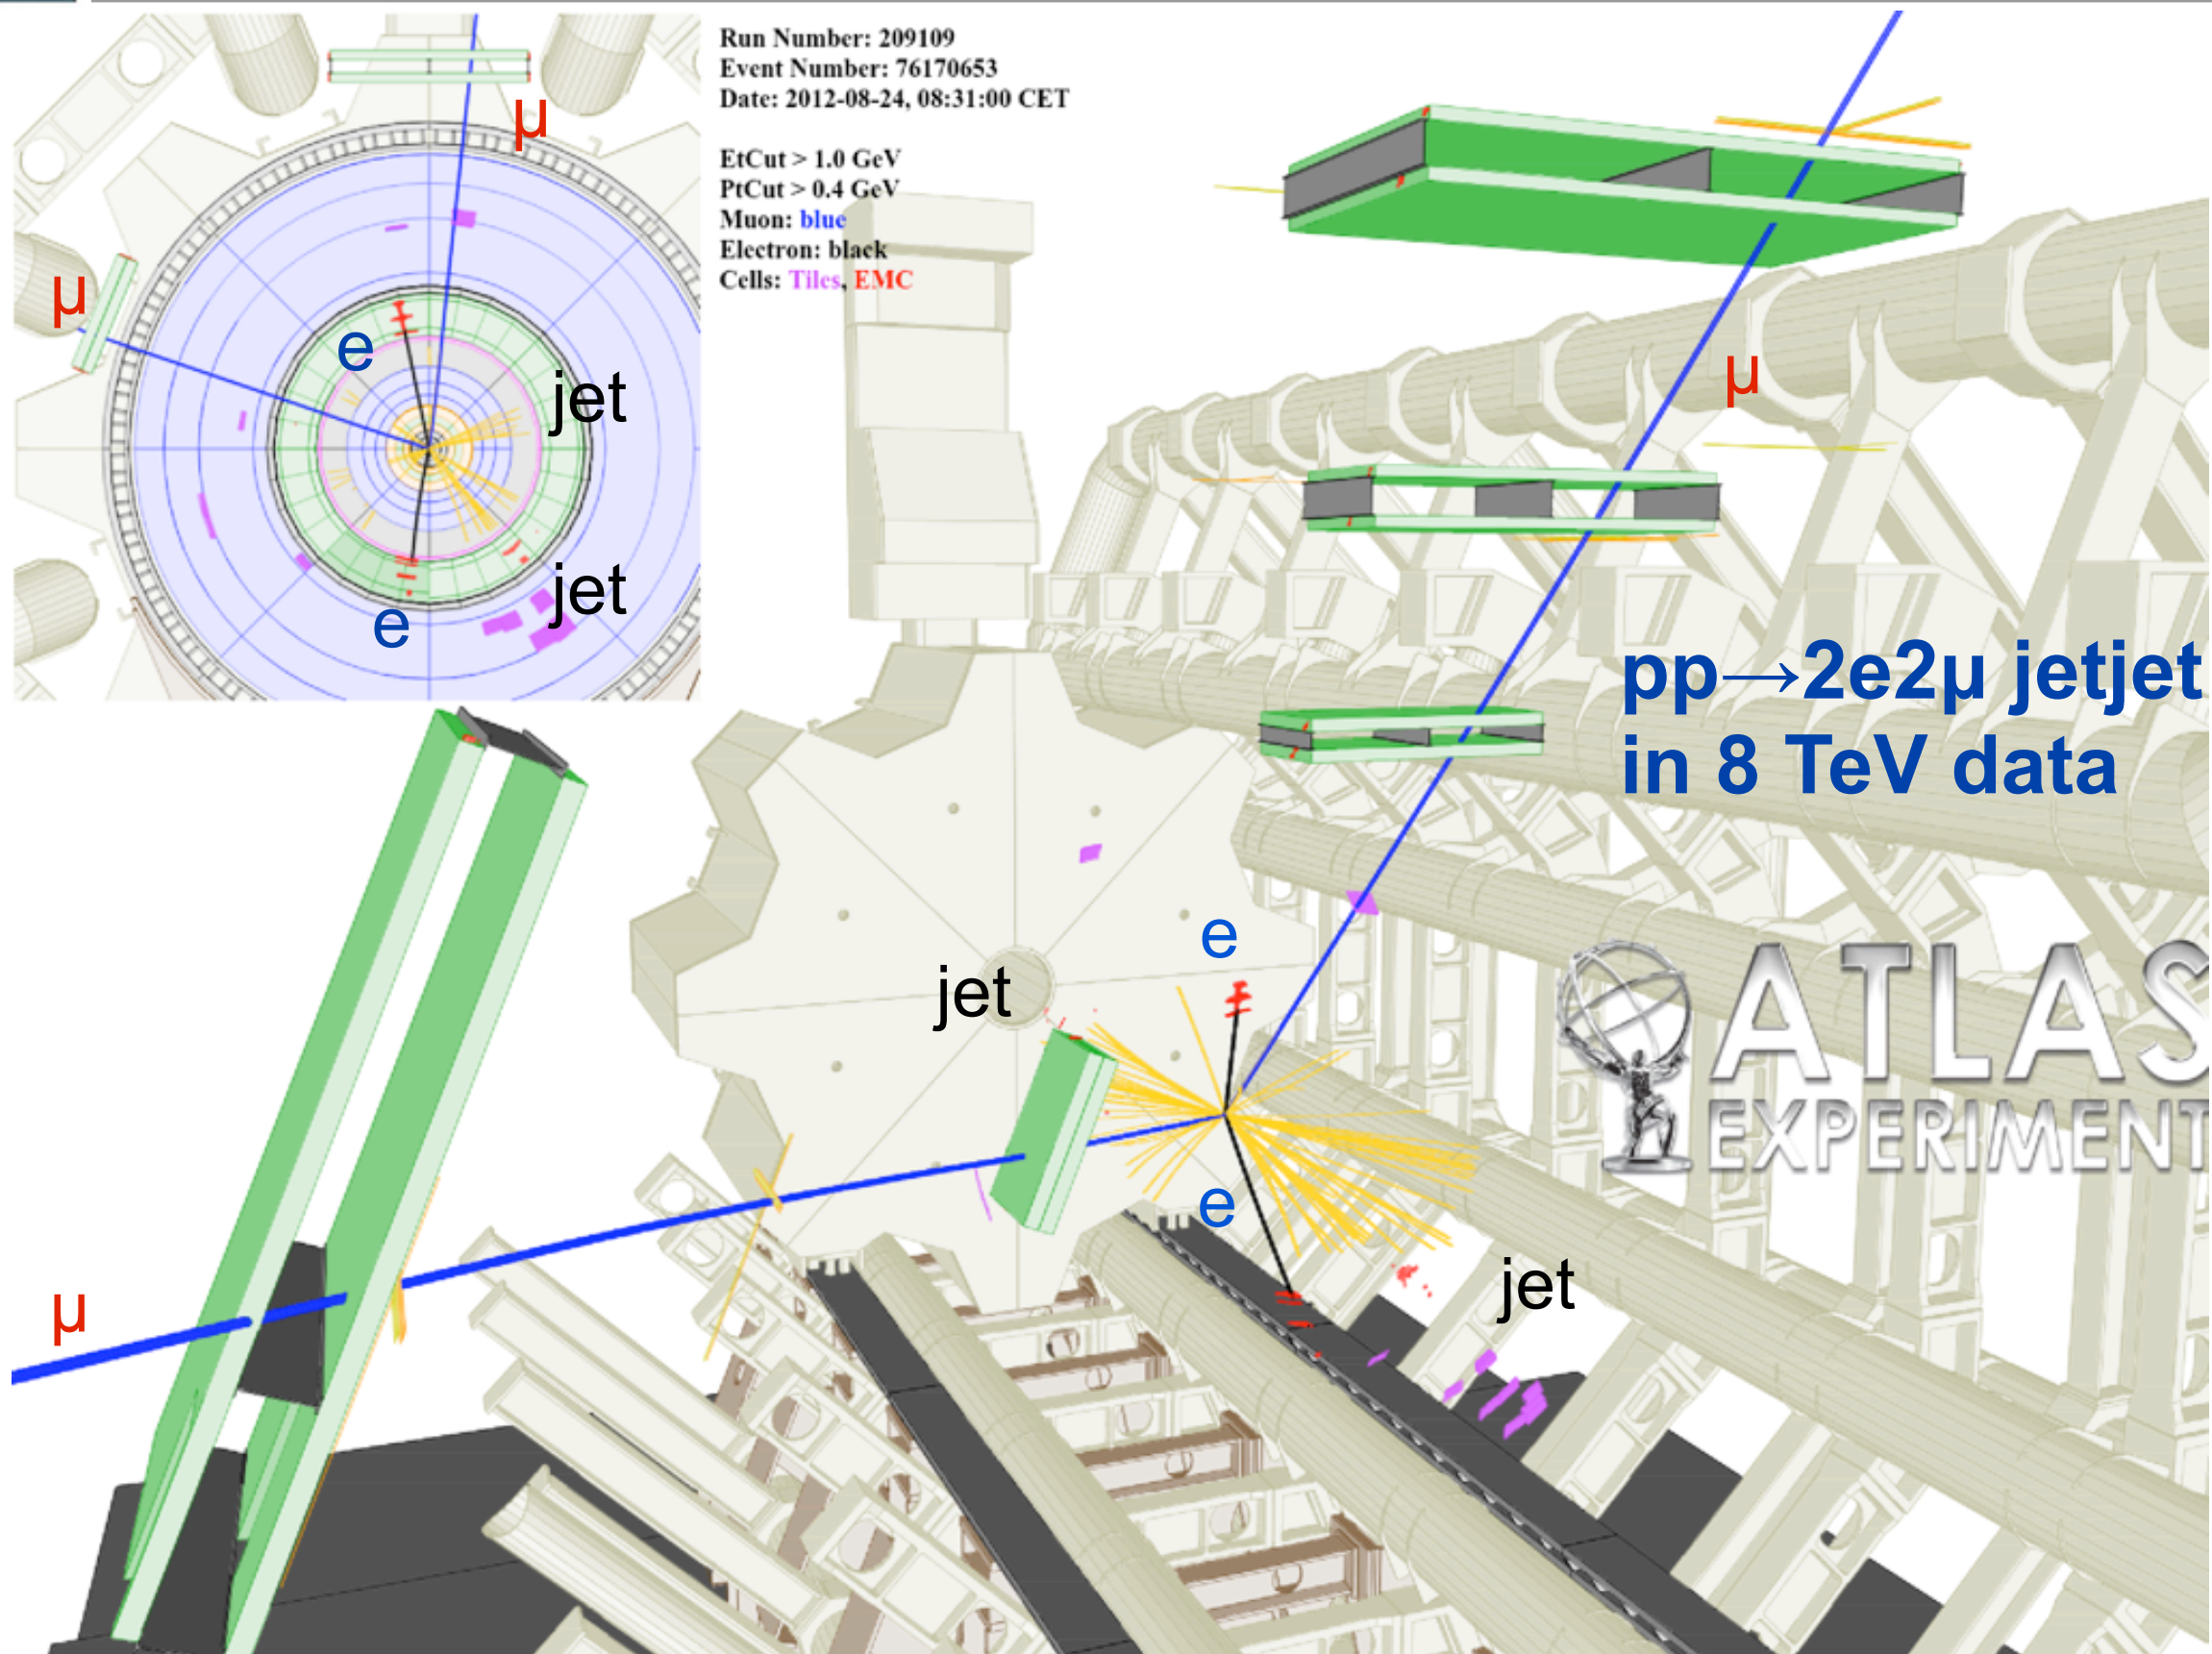

Better yields...

Large backgrounds

## Detector needs

Excellent lepton ID, energy resolution, hermeticity, jet tagging at high  $\eta$

# VBF $2e2\mu$ candidate event

# VV scattering: fully leptonic

Only background VV+jets, very low xsec

Number of events for  $20 \text{ fb}^{-1}$  (fully MC based, no systematics, 14 TeV)

CMS ZZ->4e, 4μ	N signal	N back.
500 GeV	2.2	1.9
>1 TeV	0.1	0.2

CMS ZW->μμμν	N signal	N back.
>1 TeV	0.9	0.8

ATLAS ZZ->2l2ν	N signal	N back.
500 GeV	6.4	3.0

ATLAS ZW->lllv	N signal	N back.
500 GeV	8	5
1.1 TeV	1.4	0.4

Example: ggF Higgs 300 GeV

Latest results:

B~ 6

S~ 10

- reso  $m_{4l}$  as expected
- improved reco-id efficiencies

(eg ele ID: TDR time 85-90% -> today 95%)

# ZZ resonance

## $pp \rightarrow ZZ + 2j \rightarrow 4\ell + 2j$ channel

model	$300 \text{ fb}^{-1}$	$3000 \text{ fb}^{-1}$
$m_{\text{resonance}} = 500 \text{ GeV}, g = 1.0$	$2.4\sigma$	$7.5\sigma$
$m_{\text{resonance}} = 1 \text{ TeV}, g = 1.75$	$1.7\sigma$	$5.5\sigma$
$m_{\text{resonance}} = 1 \text{ TeV}, g = 2.5$	$3.0\sigma$	$9.4\sigma$

Sensitivity to anomalous ZZ resonances in Vector boson scattering

# SUSY

## Summary of CMS SUSY Results\* in SMS framework LHCP 2013

## Summary of CMS RPV SUSY Results\* LHCP 2013

## SUSY limits at a glance

EWKinos ~200-400 GeV  
Stop, sbottoms ~200-600 GeV  
Squarks, gluinos ~600-1300 GeV

# SUSY reach at higher luminosity

Going from  $L=300 \text{ fb}^{-1}$  to  $L=3000 \text{ fb}^{-1}$  the sensitivity to 1st and 2nd gen squarks and gluinos improves by ~400-500 GeV, while to stops by about 200 GeV

# SUSY reach at higher luminosity

LHC at 14 TeV expands the reach for SUSY particles to much higher masses. (HE-LHC at 33 TeV does it even more)

As expected, the gain with HL-LHC is more modest ( $\sim 25\%$ ) in this case.

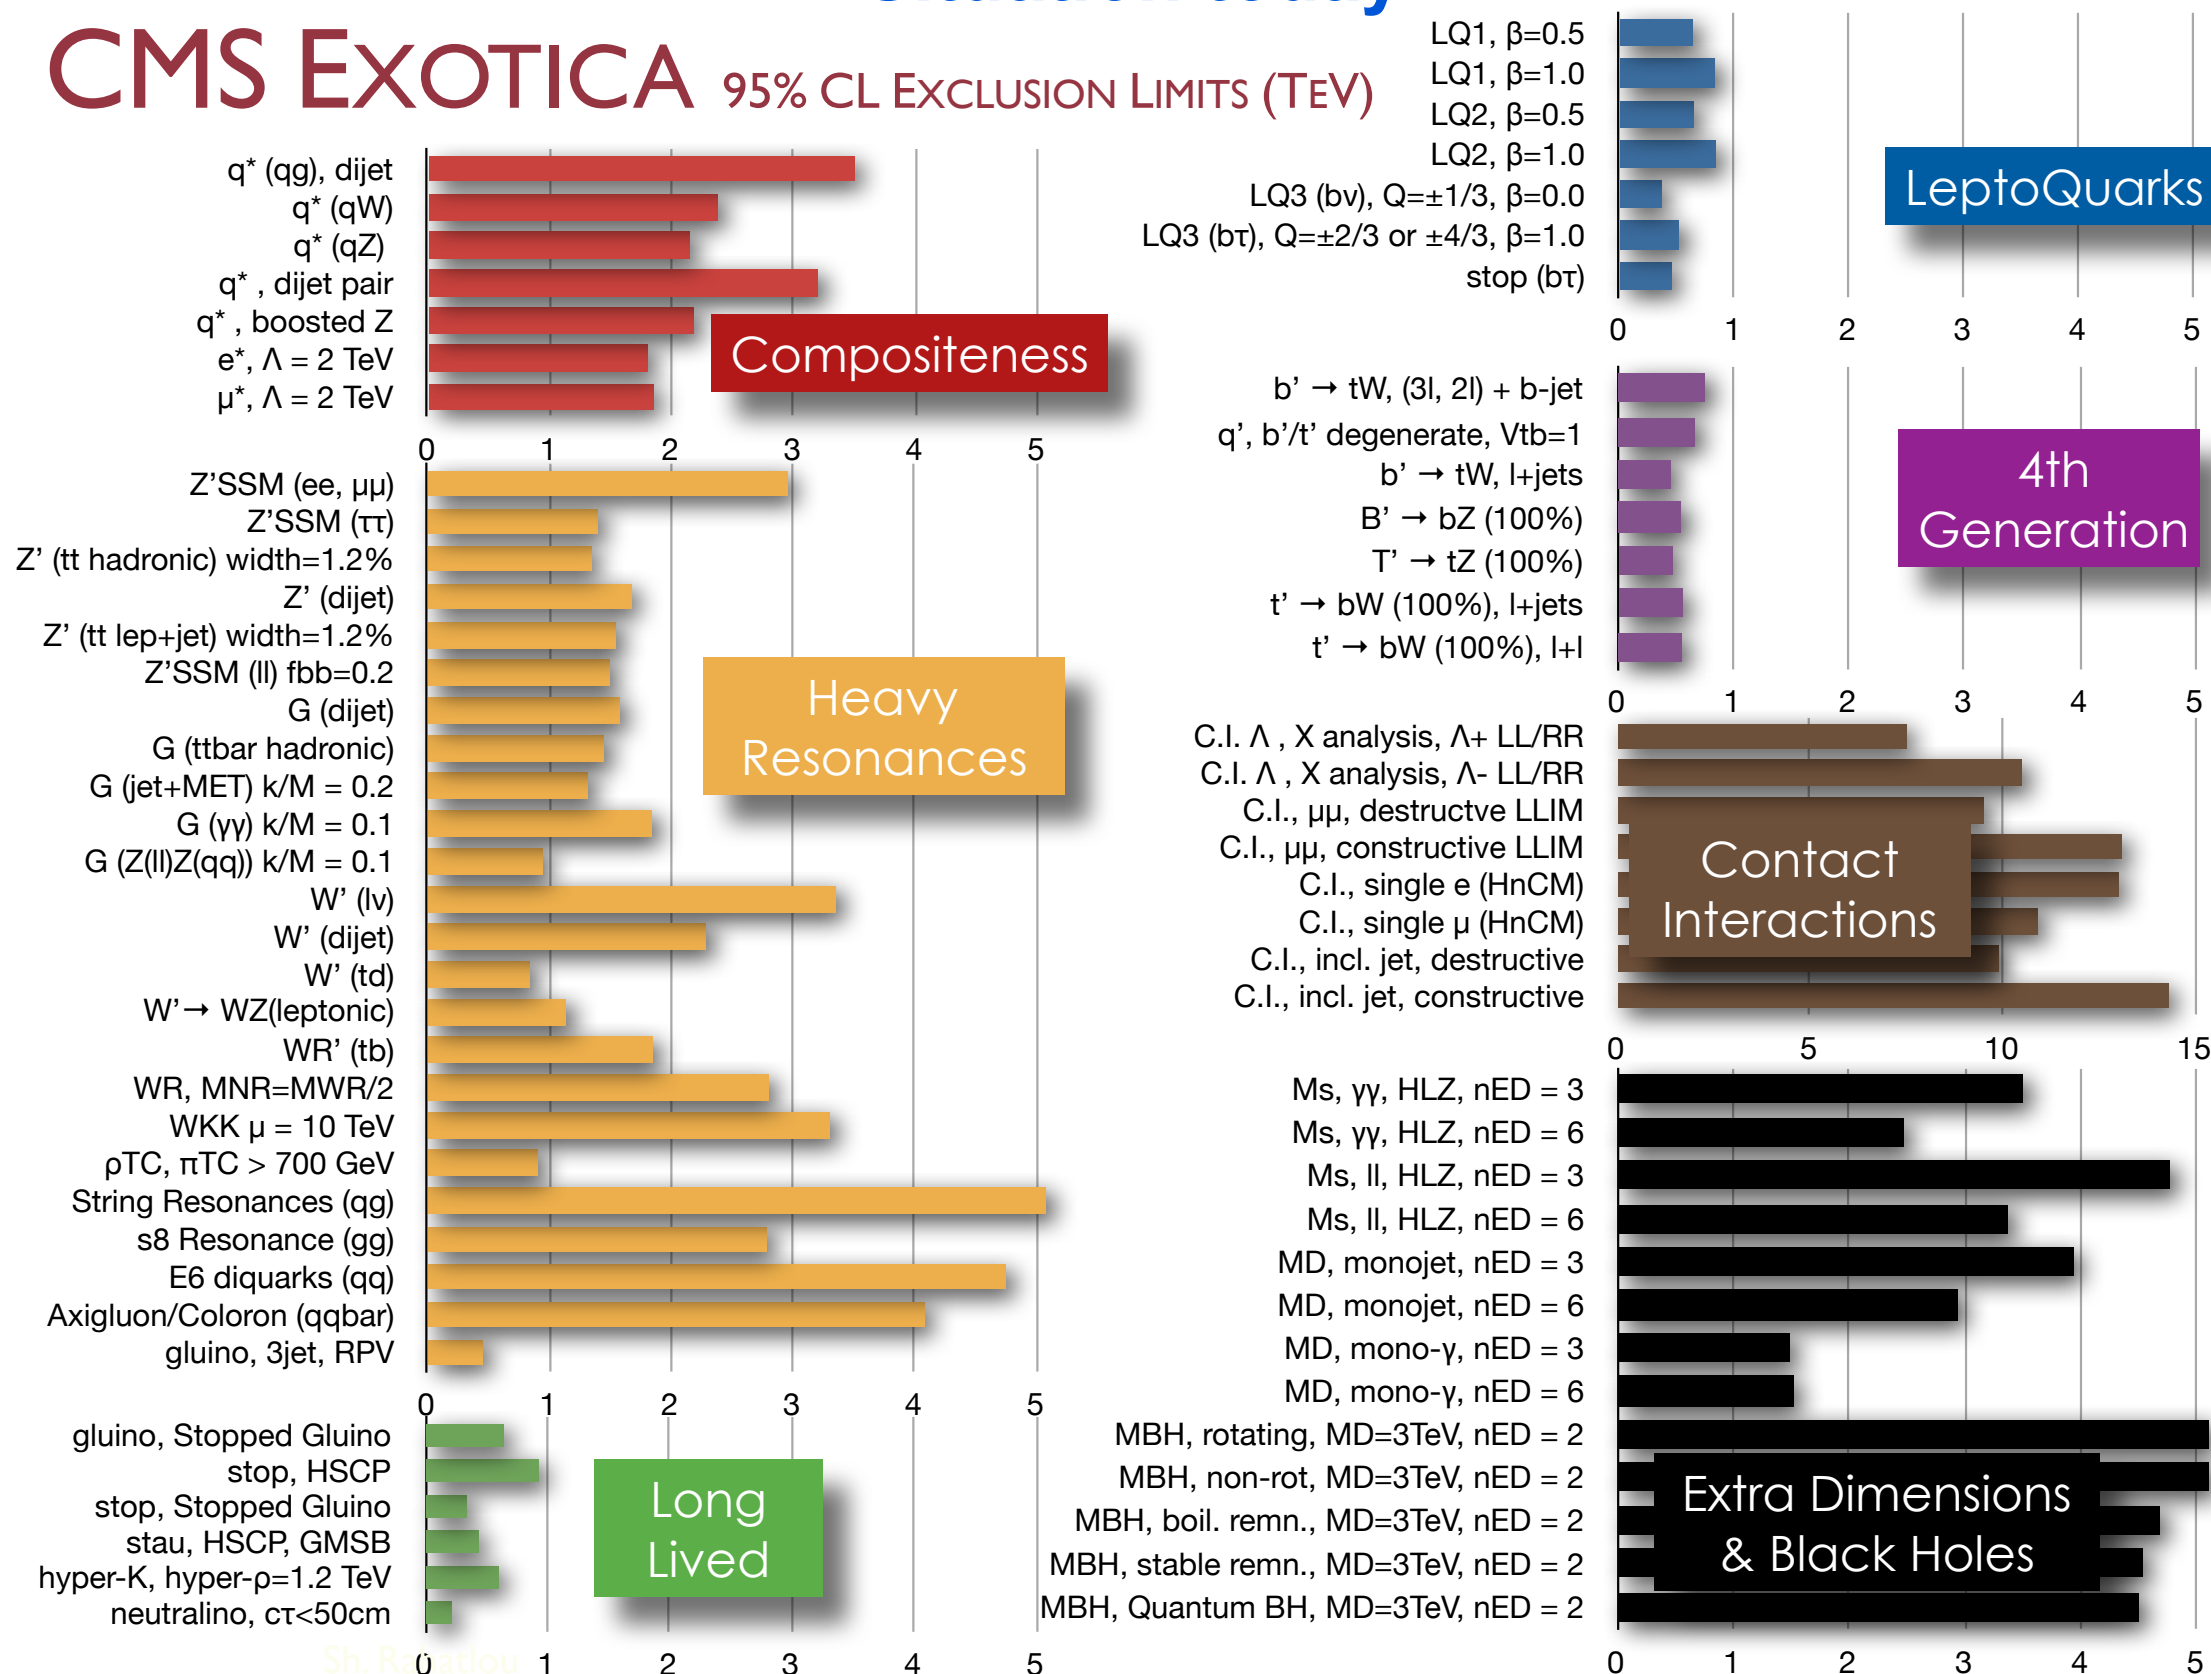

SUSY reach with  $300 \text{ fb}^{-1}$   
EWKinos up to  $\sim 800 \text{ GeV}$   
Stops,sbottoms up to  $\sim 1 \text{ TeV}$   
squarks,gluinos up to  $\sim 2.5 \text{ TeV}$

Low S/B	1.6	1.8	2.5
High S/B	1.7	2.3	3.5

## Caveat

Many of the projections and studies that I presented are being improved and updated for the **ECFA workshop** of october 2013, so stay tuned...

# Conclusions

- ATLAS and CMS have exceeded their design performances during the first LHC run, showing that precision physics can be made under these conditions.
- The experience gained and a sound program of upgrades gives us confidence that the experiments will meet the physics expected with 300 fb<sup>-1</sup>, collected at  $\sqrt{s}=14$  TeV and instantaneous luminosities up to  $2 \times 10^{34} \text{cm}^{-2}\text{s}^{-1}$ .
  - A new energy domain with a vast potential for new physics discoveries
  - All existing searches will be very quickly updated
- With HL-LHC a further increase of the discovery phase-space is possible.
- Precision SM scalar boson physics at HL-LHC is an attractive future scenario deserving substantial studies and R&D.
  - it is a challenging project involving major upgrades of full detectors.
  - scalar boson couplings can be measured with few percent precision
  - rare scalar boson decays, self-coupling studies possible
  - VV scattering will be probed
- LHC has an exciting physics program for the next twenty years!

# Backup

# Trigger challenge in 2012

Maintaining high trigger efficiency while keeping the trigger rate within budget was one of the biggest challenges of the CMS experiment in 2012

The experience obtained in 2012 with peak pileup of  $\sim 35$  events gives us confidence for high-luminosity running post Long Shutdown 1

## Trigger Cross-sections:

## HLT CPU time:

- linear with PU, no signs of runaway

# Tracking and b-tagging performance

Improvement of b-tagging efficiency  
with new pixel detector

b-tagging efficiency  $\sim 1.3x$  better  
2 b-jets  $\rightarrow (1.3)^2 \sim 1.69$

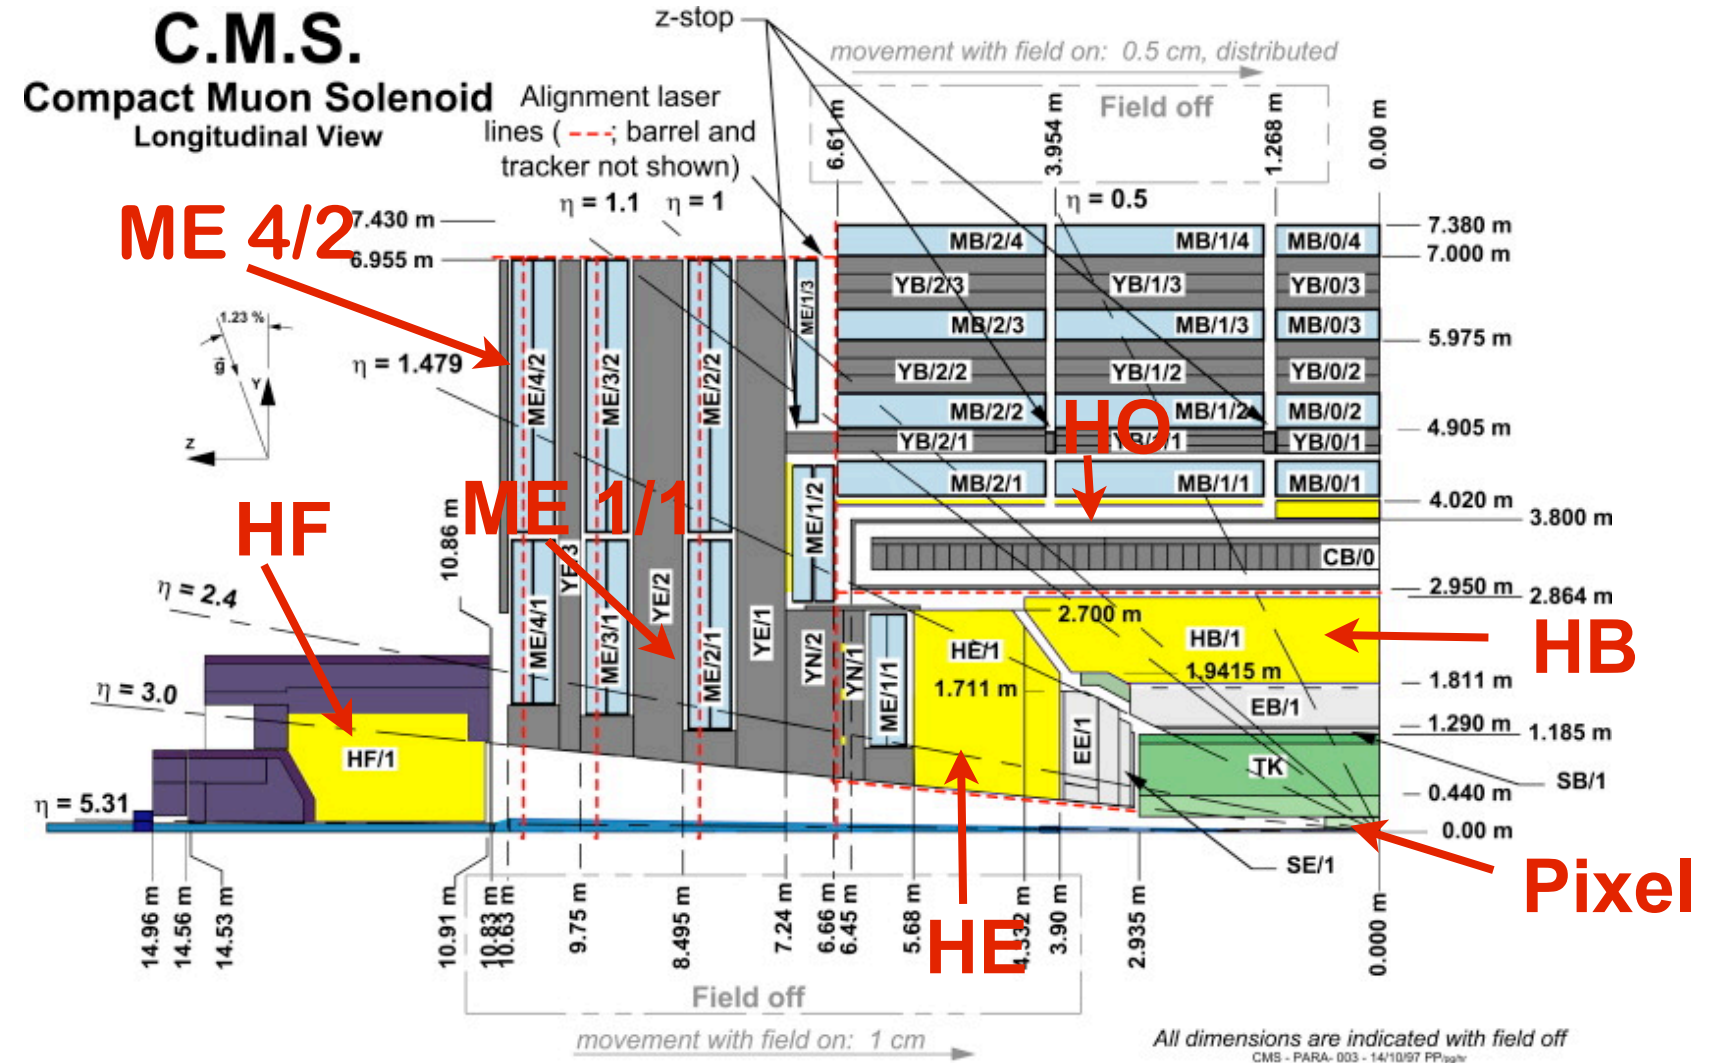

Primary vertex resolution improved by factor  $\sim 1.5 - 2$

Improvement in tracking efficiency w/  
new pixel detector, in ttbar events, as  
a function of pileup

# CMS Upgrade program

## LS1 and Phase 1

- Upgraded HCAL
  - New photodetectors
  - New electronics (frontend, backend)
  - Improved longitudinal segmentation
  - Improved background rejection, Missing  $E_T$  resolution and Particle Flow reconstruction
- Hadronic showers spread out with increasing depth

# Pileup challenges

Reconstruction of hard collisions in high pileup environment requires detectors with very high granularity:

- efficient association of charged tracks to collision vertices
- reconstruction of charged and neutral particles in jets
- pileup neutrals corrected w/global energy density ( $\rho$ )

Physics with high pileup requires full particle flow reconstruction assuring:

- precise jet energy correction
- robust missing energy measurement
- efficient lepton isolation

Very efficient reconstruction code is needed to stay within computing budget

## Muon isolation

# Vector Boson Fusion (VBF)

Generic diagram for vector boson fusion (VBF) process

Signature: forward-backward  
“spectator” jets with very high energy

- Once the vector bosons decay, we have a **six-fermion** final state
- The full set of  $qq \rightarrow 6$  fermions diagrams has to be considered
- In order to investigate EWSB, one has to isolate VV processes from all other six-fermion final states

➡ Apply tight kinematic cuts

Typical kin. cuts

$$p_{T,j} > 20 \text{ GeV} \quad |\eta_j| < 5 \quad p_T^{\text{tag}} > 30 \text{ GeV} \quad |\eta_{j1} - \eta_{j2}| > 4.0$$

$$\eta_{j1} \cdot \eta_{j2} < 0 \quad m_{jj} > 600 \text{ GeV}$$

# VV scattering: semileptonic

**Semileptonic is most promising: reasonable signal yield**

**Number of events for  $20 \text{ fb}^{-1}$**  (fully MC based, no systematics, 14 TeV)

	ATLAS			CMS			CMS		
		N sign.	N back.		N sign.	N back.		N sign.	N back.
<b>WV <math>\rightarrow</math> <math>l\nu jj</math></b>	500 GeV	6.2	16	500 GeV	337	20759	500 GeV	62	3415
	800 GeV	13	17						
	1.1 TeV	4.8	9.2	>1 TeV	45	3281	>1 TeV	5	348
<b>ZV <math>\rightarrow</math> <math>ll jj</math></b>									

For recent inclusive Higgs search:

- more sophisticated analysis developed (btag categories, angular analyses,  $m_{jj} = m_Z$  kinematic fit)
- data driven background

**Improved JES:**  $m_{jj}$  reso from 20-25% to 10-15%
